

Understand the launch.

Before you trade.

A clear review of Meteora token launch choices, in one place. Explore a launch, understand its settings and share what you find.

Launch choices are hard to judge.

A token launch comes with choices about supply, trading fees and future liquidity.

People need those choices explained clearly when deciding what to explore next.

An address becomes a clear review.

Paste a Meteora pool address. Read a structured review of the launch, with the underlying evidence close at hand.

Share your findings with a link or a visual report.

More choice deserves more clarity.

Meteora gives launch creators choices about how a token enters the market.

DBC Guard makes those launch choices understandable, helping people explore the ecosystem with better context.

Different questions. Different tools.

Rugcheck: a token risk overview.

DEX Screener: market activity and charts.

Solscan: exploring on-chain records.

DBC Guard: reviewing Meteora launch configuration.

Our focus is the launch itself: making its choices easier to understand and discuss.

Open it. Explore a launch.

DBC Guard is live at dbc.whoim.space and works on desktop and mobile.

Start with a pool address. Share a link, download a visual card or save the report.
No account or wallet required.
